GA4 PURCHASE FUNNEL ANALYSIS

One-page decision memo | Draft template - complete only after running and validating the SQL

TO: E-commerce Product / Growth Lead	**FROM**: [Your name]	**DATE**: [Date]

SUBJECT: Investigate [qualified segment and funnel step] first

DRAFT - NOT A FINAL FINDING

BOTTOM LINE

Investigate **[segment / funnel step]** first. Based on the observed comparison with **[benchmark]**, closing 25%-50% of the measured checkout-completion gap is estimated to represent **$[low]-$[high]** over a comparable three-month period, subject to the assumptions below.

WHAT WE FOUND

1. Overall funnel	[actual sessions], [actual purchase sessions], [actual session-to-purchase conversion]
2. Segment comparison	[actual segment rate] vs [benchmark rate]; [actual percentage-point gap]
3. Uncertainty / checks	[actual p-value], 95% CI [actual interval]; transaction and session checks [outcome]

SIZE OF THE PRIZE

25% gap closure: $[value] | 50% gap closure: $[value] | 100% gap closure: $[value]

This is opportunity-sizing arithmetic, not a forecast. It assumes the benchmark is partly reachable and average transaction revenue applies to incremental orders.

RECOMMENDED ACTION

Hypothesis: [specific change] will improve [primary metric] for [segment]. Randomise at the user level 50/50; run at least one to two full weeks subject to sample-size planning. Primary metric: checkout-to-purchase rate. Guardrails: average order value, refunds and error rate. Define the minimum detectable lift and success criterion before launch.

CAVEATS

Obfuscated sample for one store, 2020-11-01 through 2021-01-31, including holiday season; traffic_source is first-touch acquisition, not session attribution; headline funnel uses cumulative flags without time ordering; observational differences do not prove causation; no cost or margin data.

METHOD: [actual event/session volume], GA4 nested parameters with UNNEST, session-level cumulative funnel, segment comparisons, gap-closure scenarios and two-proportion significance check.

Before publication: replace every bracketed placeholder with verified query output; remove this draft warning only after the quality checklist passes.
